The invention relates to polynucleotides encoding breast tumour polypeptides. The sequences are useful for treating cancer, preferably breast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that binds to a breast tumour polypeptide, detecting in the sample an amount of polypeptide that binds to the binding agent, and comparing the amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient. Sequences AAU82641-AAU82655 represent human breast tumour polypeptides of the invention.
                                                                   The present sequence is encoded by a cDNA sequence which was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to produce a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotides encoding breast tumour polypeptides, useful for treating breast cancer or stimulating an immune response -

The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors. TIE ligands and various enzymes. The membrane-bound proteins and receptor immunoadhesins, for instance, can be used as therapeutic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PRO polypeptide; mammal; tumour; cancer; human; cattle; horse; sheep;

and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammallan subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

```

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats

Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW94264
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                               The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloactive molecules, such as conclusive and their standard send that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays.

ARF4270 to AAF4470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AF44087 to AAF4269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein can be exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                     ;

The present invention relates to an isolated antibody that binds to tumor-associated antigenic target (TAT) polypeptide. The antibody is used for treating and diagnosing tumours (e.g. breast, lung, liver or stomach tumours) in mammals, e.g. dogs, cats, cattle, horses, sheep, pigs, goats, rabbits, or preferably humans. The antibody may also be used in antibody-dependent enzyme mediated prodrug therapy (ADEPT). The antibody is also useful for the therapeutic treatment or for the diagnostic detection of cancer. TAT cDNA is useful in gene therapy. The present sequence is human TAT173 protein. TAT173 cDNA is designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin; H6FXTN23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides, useful for treating and diagnosing tumor (e.g. breast, lung, liver or stomach tumor) in mammals, e.g. dogs, cats, cattle, pigs, goats, rabbits or humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibodies that bind tumor-associated antigenic target (TAT)
                                                                                                                                                                                                                                                                                                                                                              Gurney AL, Polakis P;

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranecth protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural construct comprise at least one tetranectin trimerising structural construct comprise at least one tetranectin trimerising structural construct compares with a large scale of forming a stable complex with 2 other construct on proteins CIHGFXTN123, H6FXTN123, H6FXTN13, H6FX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                     New monomer polypeptide constructs for diagnosis and therapy - comprise a tetranectin trimerising structural element covalently linked to at least one heterologous molety for providing functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;. The invention relates to the design of trimeric polypeptides using collypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural construct comprise at least one tetranectin trimerising structural molecy, the TYSE being capable of forming a stable complex with 2 other molecy, the TYSE being capable of forming a stable complex with 2 other any of the fusion proteins CITHGFXNN123, H6FXTN123, H6FXTN123, H6FXTN123, CAMM94261 to AMM94264). The TYSE can be used for the construction of structure, a toxin, a detectable label, an in situ activatable substance, a nadioactive molety, a cytokine, a non-proteinaceous polymer, or a protein can be used as vehicles of for assembling antibody fragments into oligomeric or multivalent construct to a target. They can be used as vehicles of the structures can be used as vehicles of preselected pharmaconshiner; and for targeted agency phacing selective constructs. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific population of cells. They can also be used for delivering a substance of acill or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a human tetranectin sequence from which the TTSE can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TFSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSE, with the proviso that the heterologous moiety is different from any of the fusion proteins CIH6FXTN123, H6FXTN123, H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

cDNA encoding human tetranectin (full sequence given in AAR60521) was PCR amplified using primers given in AAQ71274-75. Amplified cDNA was linked to a sequence encoding the Factor-Xa cleavage site (given in AAR60503), subcloned in vector p77H6 so that it was linked to a hexahistidine-encoding sequence and expressed in E. coli BL21. The fusion protein was purified on an Ni2+-activated NTA-agarose column. A cyclic procedure was used to obtain correctly folded recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The inventorial tenance to the uesayu of Linguistic putypeptides tructural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural comprise at least one tetranectin trimerising structural construct comprise at least one tetranectin trimerising structural comprise. The trimerist construct comprise at least one tetranectin trimerising structural comprises with the proviso that the heterologous molety is different from any of the fusion proteins CIIHEYNNI23, HERYNNI23, HERYNNI24, HERYNNIA4, HERYNNIAA, HERYNN
                                                                                                                                                                                                     New monomer polypeptide constructs for diagnosis and therapy - comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional
                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the design of trimeric polypeptides using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, plg, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess blodiversity and for nutritional purposes. The present sequence is a

                                                                                                                                                                                                                                     formula shown in AAP60098. Tetranectin stimulates and controls the plasminogen activation resulting in a higher rate of clot lysis or fibrinolysis, esp. in the presence of blood platelets and in the presence of a complex fibrin clot from blood. It stimulates and controls the plasminogen activation in the absence of fibrin but in the presence of a cofactor such as polylysine.

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the proviso that the heterologous moiety is different from any of the fusion proteins CIMERTWAL23, HERYANL2, HERYANL3 (AAM94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moieties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, conjugates with heterologous moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific conjugated at the ordinanosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence can also be used for delivering a substance to call sequence was amplified by PCR from the plasmid clone p7746FXTN123.

This is used in the construction of E. coli expression vectors for the construction of trimerised chimneric fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin.

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein construct comprise at least one tetranectin trimerisal proteins construct comprise at least one tetranectin trimerisal ostructural construct comprise at least one tetranectin trimerisal ostructural construct comprise at least one tetranectin trimerisal structural construct comprise at least one tetranectin trimerisal ostructural constructural constructural constructural constructural constructural constructural construction of the fusion proteins CIHEFKTN123, HEFKTN123, Conjugates with heterologous moieties such as a ligand binding conjugates with heterologous moieties such as a ligand binding conjugation to a constructure, a coxin, a detectable label, an in situ activatable substance, a newsyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer. Confugation antibody fragments into oligomeric or multivalent monomer polypeptide construct to a group facilitating conjugation of the constructs can be used for targeted gene therapy involving selective constructs can be used for trargeted gene therapy involving selective constructs can be used for trargeted gene therapy involving selective contribudy to a tumour. They can also be used for prevention or treating a citized contrology to a tumour. They can also be used for prevention a substance to contrology to a tumour. They can also be used for prevention a cutoacting a cat as a vehicle for a wide variety of conjugates. The present sequence represents a HEFKTLIPA fusion protein sequence encoded by the plasmid
                                                                                                                                                                                                                                                                                                                                                             New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional
                                                                                                                                                                                                                                                               Kastrup JS;

                                                                                                                                                                                                                                                                                                            Nucleic Acids Res. 28:1397-1406(2000).

-!- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON GRADIENT ACROSS THE MEMBRANE. THE V-TYPE ALPHA CHAIN IS A CATALYTIC SUBUNIT.

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- SIMILARITY: BELONGS TO THE ATPASE ALPHA/BETA CHAINS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pfam; PF00006; ATP-synt_ab. 1.

The rad50/mrell complex possesses single-strand endonuclease activity and ATP-dependent double-strand-specific exonuclease activity. Rad50 provides an ATP-dependent control of mrell by unwinding and/or repositioning DNA ends into the mrell active site (By
